

Amendments to the Specification:

Please replace the last paragraph at page 9 and which continues to page 10 with the following:

Figure 1 shows two storage devices 1 and 2 which - adjusted to each other - are alternately filled with bulk goods via feeding device 100 and emptied, in order to enable bulk goods to be continuously fed and withdrawn. Each of the two storage devices 1 and 2 is a silo comprising a vertically standing, circular annular cylindrical storage container 3. The storage devices 1 and 2 serve to store bulk goods consisting of or largely comprising interlocking particles of bulk goods, such as for example chips for OSB plates. The two storage devices 1 and 2 are formed identically, such that in the following, apart from the adjusted operation, only one of the storage devices 1 and 2 is ever described, representative for the other storage device as well.
